

AUTONOMOUS SPY OPTIONS AGENT

Augur

Reads the prior SPY session through an **Auction Market Theory** lens, writes the day's narrative at the open, then tests it every five minutes from 09:40 to 15:55 ET. Entry size, stops, targets and a 10% daily loss floor are **enforced in code**, not left to the model.

augur-506910.web.app

A narrative at the open, then a decision every five minutes.

The model trades through an Alpaca MCP server.

It runs as a local subprocess in the same container, exposing an **allowlist** of option-data and order tools. Every call is recorded with its arguments and result; account state and risk checks go direct over REST.

Two DeepSeek models, split by how often they run.

MODEL	JOB	CADENCE
DeepSeek V4 Pro	Reads the prior session, writes the narrative and the level map	once, at the open
DeepSeek V4 Flash	Evaluates the tick, proposes the contract and the order	every 5 min · 76 a session

Both run on **Featherless**. The tick model gets four minutes per decision and eleven Alpaca MCP tools — eight read-only, three that can close, cancel or replace an order. Whatever it returns has to match a JSON schema generated from the decision model itself, so a malformed answer never reaches the market. The narrative model gets a single tool, and has to check its own levels with it.

Gap down through prior value, held seven minutes, +\$1,230.

Large true gap down through prior session structure with continued selling below initial balance low (761.20) to new session lows (760.71). Price acceptance below all prior references confirms structural breakdown. Failure to reclaim 761.20 keeps downside discovery open with no nearby support.

decision 2026-09-01-1435 · confidence 0.65 · discovery_down · 14 tool calls

Contract	SPY260902P00762000
Plan	entry 760.77 · stop 762.00 · target 759.54
Filled 14:38	15 × 2.85
14:40 unrealised	+75.00
14:45 unrealised	+945.00
Closed 14:45	15 × 3.67
Realised	+1,230.00

Gap up above prior value, invalidated inside half an hour, −\$1,845.

SPY gapped above the prior session high (766.43) and the first two 5-min bars closed near their highs, confirming acceptance above prior value. As long as price stays above 766.43, continuation is favoured. Invalidation below 766.30 would mean the gap failed and the auction is repairing back into prior range.

decision 2026-09-03-0940 · confidence 0.65 · discovery_up · 10 tool calls

Contract	SPY260904C00768000
Plan	entry 769.75 · stop 766.30 · target 773.20
Filled 09:42	15 × 3.48
09:45 unrealised	+150.00
10:05 unrealised	−1,410.00
Stopped 10:10	15 × 2.25 · −35.3%
Realised	−1,845.00

Every entry re-checked in code after the model produces it.

CONTROL	VALUE	ENFORCED BY
Max entry size	20 contracts, agent-sized	policy validation
Expiry / delta	1-5 DTE · 0.55-0.65	policy validation
Quote freshness / spread	5s · \$0.15 and 5%	policy validation
Premium stop	-35%	risk watcher
Break-even trigger / target	+20% · +50%	risk watcher
Daily loss limit	10% of starting equity	tick context

A proposal that fails validation is **recorded with the reason** rather than dropped, and ticks outside 09:40–15:55 ET write nothing at all. The two trades shown ran under the earlier fixed 15-contract size.

Four sessions, 254 recorded evaluations, every one verifiable.
